Supplementary Figure 2. DPP microparticles lower IOP after translimbal laser. IOP was followed after DPP (squares, n=10) or control (circles, n=10) microparticle injection at day 0 and translimbal laser performed at day 2 (arrow). (A) No significant difference in IOP occurred in fellow, untreated eyes that were not exposed to translimbal laser. (B) Significant IOP reduction was seen in DPP-treated eyes exposed to translimbal laser (** = p <0.005, * = p < 0.05). Error bars indicate ±SD.
